INITIAL ORTHOPEDIC CONSULT EXAMINATION

CHIEF COMPLAINT: Right shoulder pain.

HISTORY OF PRESENT ILLNESS: A 43-year-old right-hand dominant female involved in a motor vehicle accident on 05/04/2022. The patient was a front passenger and was wearing a seatbelt. The vehicle was struck on the front driver side. The airbags did not deploy. The EMS did not arrive on the scene. The police were called to the scene of the accident. The patient did not go to any hospital that same day. The patient presents today complaining of right shoulder pain sustained in the motor vehicle accident. The patient was attending physical therapy for the last 3 months with little relief.

WORK HISTORY: The patient is currently working.

PAST MEDICAL HISTORY: Hypertension. There is no previous history of trauma.

PAST SURGICAL HISTORY: C-section in 1996, 1998, and in 2012.

DRUG ALLERGIES: NO KNOWN DRUG ALLERGIES.

MEDICATIONS: The patient is taking amlodipine 5 mg.

SOCIAL HISTORY: The patient is a nonsmoker. The patient drinks alcohol socially. The patient does not use recreational drugs.

ADL CAPABILITIES: The patient states that she can walk for 1/2 block. She can stand for 5 minutes before she has to sit. She can sit for 5 minutes before needing to change positions secondary to pain. As a direct result of the injuries sustained in this accident, the patient states that she is unable to do the following activities: lifting heavy objects, carrying heavy objects, reaching overhead, laundry, shopping, running errands, and exercising.

PRESENT COMPLAINTS: Right shoulder: Right shoulder pain is 9-10/10, described as constant, sharp, stabbing, dull, achy pain. The patient has stiffness, weakness, popping, and clicking. The patient is able to reach overhead, able to reach behind the back, and unable to sleep at night due to pain. Worse with range of motion and improves with medication.

REVIEW OF SYSTEMS: Temperature taken at the time of exam was 98.6 degrees Fahrenheit.
General: No fever, chills, night sweats, weight gain, or weight loss.
HEENT: No double vision, eye pain, eye redness, decreased hearing, earache, ear ringing, nosebleeds, sore throat or hoarseness.
Endocrine: No cold intolerance, appetite changes or hair changes.
Skin: Clear, no rashes or lesions.
Neuro: No headaches, dizziness, vertigo or tremor.
Respiratory: No wheezing, coughing, shortness of breath or difficulty breathing.
Cardiovascular: No chest pain, murmurs or irregular heart rate. The patient has hypertension.
GI: No nausea, vomiting, diarrhea, constipation, jaundice or changes in bowel habits.
GU: No blood in urine, painful urination, loss of bladder control or urinary retention.
Hematology: No active bleeding, bruising, anemia or blood clotting disorders.
Psychiatric: No anxiety, change in sleep pattern, depression or suicidal thoughts.

PHYSICAL EXAMINATION: The patient's height is 5 feet 3 inches, weight is 120 pounds, and BMI is 21.3. The right shoulder reveals tenderness to palpation over supraspinatus tendon region, AC joint, and proximal biceps tendon. There is crepitus appreciated. There is no heat, swelling, erythema or deformity appreciated. Negative drop arm test. Positive cross-over test. Positive empty can test. Positive Yergason test. Negative deltoid atrophy. Negative O'Brien test. Positive impingement sign. Positive Lift-off test. Positive Hawkins test. Range of motion, as per goniometer, abduction 120/180 degrees, adduction 30/45 degrees, forward flexion 135/180 degrees, extension 45/60 degrees, internal rotation 40/90 degrees, and external rotation 65/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the right upper extremity.

DIAGNOSTIC TESTING: MRI of the right shoulder, done on 07/28/2022, shows mild hypertrophy of the acromioclavicular capsule contacting the bursal surface of the supraspinatus muscle/tendon. Trace amount of fluid in the subacromial-subdeltoid bursa. Small amount of fluid surrounding a normal bicipital tendon within the bicipital groove. This may relate to mild tenosynovitis which should be correlated clinically.

ASSESSMENT:
1. M24.811 Internal derangement, right shoulder.
2. M75.81 Shoulder tendinitis, right shoulder.
3. M75.41 Impingement, right shoulder.
4. M65.811 Tenosynovitis, right shoulder.
5. M75.51 Bursitis, right shoulder.
6. M25.511 Pain, right shoulder.
7. S49.91XA Injury, right shoulder.

8. M89.311 Acromioclavicular joint hypertrophy, right shoulder.
9. M25.411 Joint effusion, right shoulder.

PLAN:

1. Imaging studies and clinical examinations were reviewed with the patient.
2. All treatment options discussed with the patient.
3. Cold compresses for right shoulder.
4. Continue anti-inflammatory and muscle relaxant medications p.r.n.
5. Continue physical therapy for right shoulder 3 days/week.
6. Recommend steroid injections with pain management for right shoulder. The patient refuses due to side effects.
7. Discussed right shoulder arthroscopy versus conservative management with the patient. The patient states that due to continual pain and lack of relief with physical therapy and the inability to perform day-to-day activities due to pain, the patient wants to think about surgery.
8. It is medically necessary to perform the suggested surgery to properly diagnose the patient's condition and to objectively verify presence and severity of internal derangement and other right shoulder pathology in quantitative and qualitative terms and achieve better prognosis. This surgery is crucial to provide most specific and maximally effective treatment to this patient.
9. Discussed the length of the arthroscopy, the postoperative instructions, and the option of continuing with conservative management alternatives to surgery, including no surgery.
10. All the benefits and risks of the right shoulder arthroscopy have been discussed with the patient. The risks include, but not limited to bleeding, infection, pain, stiffness, muscle injury, nerve injury, DVT, and recurrence.
11. All the questions in regard to the procedure were answered.
12. Follow up in 2 weeks for decision.

CAUSALITY: It is within a certain degree of medical certainty, that the history presented by the patient, the objective physical findings as well as the diagnosis rendered is causally related to the injury the patient incurred on the specified date. These current symptoms were nonexistent prior to the accident. Findings were discussed with the patient.

AFFIRMATION: Being duly licensed to practice medicine in the state of New York, pursuant to the applicable provisions of the Civil Practice Laws and Rules, I hereby affirm under penalty of perjury that the statements contained herein are true and accurate.
