MRI OF THE RIGHT SHOULDER

INDICATION: Pain.

TECHNIQUE: Multiple T1 and T2 weighted MRI images of the right shoulder were obtained in the axial, sagittal and coronal planes without intravenous or intraarticular contrast.

FINDINGS: There are no acute displaced fractures, dislocations, destructive bony lesions or marrow infiltration in the proximal humerus and glenoid.

The rotator cuff musculature including the supraspinatus, subscapularis, infraspinatus and teres minor are normal in bulk without atrophy, edema or fatty infiltration. The rotator cuff tendons including the infraspinatus and teres minor are intact without MRI evidence of a tear or tendinosis/tendinopathy. The glenoid labrum is grossly intact. There are no masses associated with the glenohumeral joint.

There is a full-thickness tear of the anterior fibers of the distal supraspinatus tendon, although posterior fibers are intact. There is a partial tear of the distal subscapularis tendon. Fluid in the long head of the biceps tendon sheath consistent with tenosynovitis. Edema in the distal clavicle and adjacent acromion with fluid in the acromioclavicular joint, consistent with recent trauma. Fluid in the subacromial/subdeltoid bursa suggestive of underlying rotator cuff tears and/or subacromial/subdeltoid bursitis, in an appropriate clinical setting. Mild joint effusion consistent with recent trauma or synovitis, in an appropriate clinical setting.

IMPRESSION:

1. Full-thickness tear of the anterior fibers of the distal supraspinatus tendon, although posterior fibers are intact.
2. Partial tear of the distal subscapularis tendon.

3. Fluid in the long head of the biceps tendon sheath consistent with tenosynovitis.
4. Edema in the distal clavicle and adjacent acromion with fluid in the acromioclavicular joint, consistent with recent trauma.
5. Fluid in the subacromial/subdeltoid bursa suggestive of underlying rotator cuff tears and/or subacromial/subdeltoid bursitis, in an appropriate clinical setting.
6. Mild joint effusion consistent with recent trauma or synovitis, in an appropriate clinical setting.
