MRI OF THE RIGHT ELBOW WITHOUT CONTRAST

INDICATION: Right elbow pain

TECHNIQUE: Multiplanar, multisequential MRI was performed in the recumbent position.

COMPARISON: There are no prior studies available for comparison at the time of dictation.

FINDINGS:

Low grade interstitial tear and strain of the distal triceps tendon at the insertion. Small joint effusion.

Exam, otherwise, demonstrates osseous structures to be unremarkable in signal, morphology and alignment. Muscular and tendinous structures, otherwise, demonstrate no altered signal or morphology. No subcutaneous or extraosseous masses or altered signals are, otherwise, identified. Medial and lateral collateral ligaments are intact.

IMPRESSION:

Low grade interstitial tear and strain of the distal triceps tendon at the insertion.
Small joint effusion.

Sincerely,

Priyesh Patel, MD
