DATE OF STUDY: 9/7/2022  
PATIENT NAME: ROSARIO YULEYSI  
DATE OF BIRTH: 7/17/1994  
PATIENT NUMBER: SR3132  
REFERRING PHYSICIAN: DR. ROSS-DISTINE

**MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST**

**HISTORY:** Patient was involved in a motor vehicle accident and now complains of pain.

**COMPARISON:** None.

**TECHNIQUE:** MRI of the right shoulder was performed using T1 and T2 weighted sequences in multiple planes.

**FINDINGS:**

Mild synovial effusion is seen. There is minimal fluid seen subacromial – subdeltoid and subcoracoid bursae.

Mild thickening of the inferior glenohumeral ligament is seen. There is mild lateral downsloping of acromion seen.

The alignment of the shoulder joint is normal. The rotator cuff is well visualized. There is no evidence of edema / tear.

The bones around the shoulder joint reveal normal intensity.

The gleno-humeral joint is normal. There is no evidence of erosion or destruction of articular cartilage. The articular margins are intact.

The glenoid labrum is normal. The acromio-clavicular joint also appears normal.

The muscles and their attachments also appear normal. Major neurovascular bundles are normal
