**PATIENT NAME:** CORSINO, JOSE  
**DATE OF BIRTH:** 01/18/1955  
**MRN #:** BR46397  
**DATE OF SERVICE:** 07/11/2022  
**REFERRING PHYSICIAN:** JORDAN FERSEL, MD

**MRI EXAMINATION OF THE RIGHT KNEE WITHOUT CONTRAST**

**INDICATION:** PAIN

**TECHNICAL FACTORS:** MRI exam of the right knee was performed utilizing multi-sequential and multi-planar imaging.

**COMPARISON:** None.

**FINDINGS:**

There is a linear focus of increased signal within the body and posterior horn of the medial meniscus which extends to the articular surface. The findings are consistent with a meniscal tear. Mild myxoid changes are present within the lateral meniscus.

The anterior and posterior cruciate ligaments appear intact.

The medial and lateral collateral ligaments, as well as the patellar ligament are intact. A small joint effusion is present. A few small popliteal cysts are noted, especially medially.

Small foci of abnormal signal along the posterior aspect of the patella suggest mild chondromalacia patellae. Correlate with plain film findings. The bony structures otherwise appear intact with no evidence of an acute fracture or dislocation.

**IMPRESSION:**

1. Medial meniscal tear as discussed above.
2. Small joint effusion with a few small popliteal cysts noted, especially medially.
3. Remaining findings as discussed above.

Thank you for the opportunity to participate in the care of this patient.
