Bronx, NY 10461PATIENT NAME: Osvaldo Rosario
DOB: 5/16/1966
DATE OF SERVICE: 11/23/2021
REFERRING DOCTOR: Adnan A. Qureshi, M.D.MRI Right Knee:

TECHNIQUE: Magnetic Resonance Imaging is Performed in Multiple Projections Utilizing T1/T2 Pulse Sequences.

FINDINGS:

The medial and lateral menisci are effaced by irregular confluent hyperintensities. Articular surfaces are undermined. Findings are compatible with tears. In addition, there is increased anterior cruciate ligament fiber interstitial intensity. Consideration is given to sprain and partial tear. Posterior cruciate ligament is without frank rupture.

Medial and lateral collateral ligaments are free from interruption. Added fluid extends along joint capsule and suprapatellar bursa. No Baker's cyst formation.

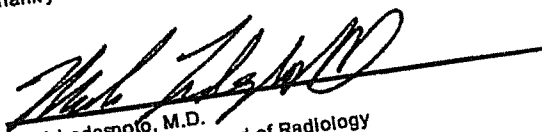

Osseous structures maintain unremarkable alignment and signal characteristics. Suspicion is not raised for fracture, subluxation, or replacement process. Chondromalacia patella has developed. Smooth femoral condyles and tibial plateaus.

There is no periarticular mass or collection identified.

IMPRESSION:

1. Evidence for medial and lateral meniscal tears.
2. Additional ACL injury suggested.
3. Quadriceps and patellar tendinitis.
4. Chondromalacia patellae.
5. Joint effusion.

Thank you for the courtesy of this consultation.
