

To: Davis, Gordon  
Exam: MRI RIGHT KNEE  
Exam Date: 10/09/2022 8:20 AM  
Accession: 33526

Patient Name: Smith, Anthony  
DOB: 04/03/1987  
Gender: M  
MRN: SmiA7251

**RIGHT KNEE MRI WITHOUT CONTRAST**

**HISTORY:** Right knee pain status post motor vehicle accident

**TECHNIQUE:** Multiplanar, multi-sequence MRI of the right knee was obtained without intravenous contrast.

**COMPARISON:** None available.

**FINDINGS:**

There is fixation hardware within the proximal tibia with exuberant associated magnetic susceptibility artifact which limits evaluation. There is an apparent postfracture deformity of the lateral tibial plateau.

There is a joint effusion. There is no popliteal cyst.

There is a deep chondral fissure at the medial patellar facet. The cartilage along the trochlea appears preserved. There is markedly limited evaluation of the medial and lateral compartment articular cartilage and menisci secondary to magnetic susceptibility artifact. The collateral ligaments also cannot be adequately assessed.

The extensor mechanism appears preserved. There is no intramuscular edema or fatty muscle atrophy. The neurovascular structures are normal in course and caliber.

**IMPRESSION:**

Fixation hardware within the proximal tibia with extensive associated magnetic susceptibility artifact which markedly limits evaluation of the knee.

Joint effusion. Deep chondral fissure at the medial patellar facet.
