## MRI SCAN OF THE LEFT HAND

**HISTORY:** History of MVA.

**TECHNIQUE:** Non-contrast MRI of the left hand was performed utilizing multiplanar and multisequence acquisition. An MRI scan of the left wrist was performed on the same day and discussed in a separate report.

## FINDINGS:

The visualized osseous structures appear intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. The joint compartments are well maintained.

There is no evidence of "bowstringing" to indicate pulley abnormality. The visualized ligamentous and tendinous structures and volar plates are intact. There is no evidence of tear.

The muscle, fat, and fascial planes are unremarkable.

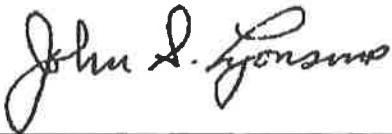

## IMPRESSION:

The osseous structures are intact.

The visualized ligamentous and tendinous structures are intact.

In the given clinical setting of trauma, the study is inconclusive which implies the need for further clinical investigation.

Thank you for the courtesy of this consultation.
