PATIENT NAME MARCANO, MAYERLING
D.O.B. 07/29/1988
PATIENT # 0000013094
DATE OF SERVICE 03/18/2022
REF. PHYSICIAN RAHMAN, QUAZI MD

MRI OF THE LEFT WRIST WITHOUT CONTRAST

INDICATION: Left wrist pain

TECHNIQUE: Axial, coronal, and sagittal T1, T2, and PD sequences were obtained in an open magnet.

COMPARISON: There are no prior studies available for comparison at the time of dictation.

FINDINGS:

No fracture and bone marrow signal preserved. Joint spaces anatomically aligned.

TFCC fraying at the articular disc and ulnomeniscal homologue. The scapholunate, lunotriquetral ligaments appear intact. Carpal alignment is normal. The flexor and extensor tendons appear within normal limits. Extensor carpi ulnaris tendon demonstrates medial positioning out of the ulnar groove with tendinopathy. No fluid is seen within the visualized tendon sheaths. The carpal tunnel, flexor retinaculum and median nerve are unremarkable.

STIR imaging demonstrates no evidence of bone edema to suggest fracture, stress reaction, or osseous lesion.

The distal radioulnar joint is in anatomic alignment.

No significant joint accumulation, fluid collections or masses are identified. No synovial thickening or cartilage defects. No volar or dorsal ganglion cysts.

IMPRESSION:

1. TFCC fraying concerning for tear at the articular disc and ulnomeniscal homologue.
2. Medial positioning of the extensor carpi ulnaris out of the ulnar groove with tendinopathy.
