MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

INDICATION: Right shoulder pain

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: Multiplanar, multisequential MRI was performed in the 30 degree tilt position.

FINDINGS:

Tendinopathy of the supraspinatus and infraspinatus tendons. Tear of the anterior labrum. Thickened subscapularis tendon, likely indicating tendinopathy. Lateral downsloping acromion.

No to get some close to evaluate this cas fracture. Bone marrow signal is normal. Glenohumeral cartilage is intact.

No os acromiale. Acromioclavicular joint is normal.

The subscapularis tendon is normal. Intact biceps tendon. The biceps anchor is intact.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No effusion. No subacromial/subdeltoid bursitis. No intra-articular loose body.

IMPRESSION:

1. Tendinopathy of the supraspinatus and infraspinatus tendons.
2. Tear of the anterior labrum.
3. Thickened subscapularis tendon, likely indicating tendinopathy.

Sincerely,

CYNTHIA SEPULVEDA
