PATIENT NAME: SHIRLEY JENNINGS
REFERRING PHYSICIAN: JURKOWICH
SERVICE: MRI RIGHT WRIST
DATE OF SERVICE: 05/04/2022

MRI SCAN OF THE RIGHT WRIST

CLINICAL HISTORY: Pain.

Routine non-contrast MRI images of the right wrist were obtained. Prior imaging correlation is not available.

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures.

There is increased signal in the medial aspect of the disk proper and the upper lamina of the triangular ligament of the triangular fibrocartilage complex. In the given clinical setting, the findings are compatible with TFCC sprains and interstitial tears. The triangular fibrocartilage complex is otherwise intact.

The carpal tunnel and median nerve are unremarkable. The flexor retinaculum bowing ratio is less than 0.15 which is within normal limits. Therefore, there is no evidence of carpal tunnel syndrome.

The visualized ligamentous and tendinous structures are otherwise intact. The muscle, fat, and fascial planes are well maintained.

IMPRESSION:

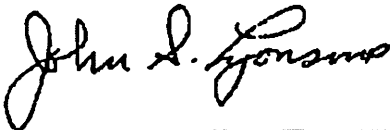

FINDINGS COMPATIBLE WITH TFCC SPRAINS/INTERSTITIAL TEARS AS DISCUSSED IN THE BODY OF THE REPORT.

THE VISUALIZED LIGAMENTOUS AND TENDINOUS STRUCTURES ARE OTHERWISE INTACT.

THE CARPAL TUNNEL AND MEDIAN NERVE ARE UNREMARKABLE.

NO ACUTE OSSEOUS ABNORMALITIES.

Thank you for the courtesy of this consultation.

John Lyons, M.D.

Radiologist
