MRI OF THE LEFT SHOULDER

CLINICAL HISTORY: Left shoulder pain, MVA.

TECHNIQUE: Multiplanar and multisequential MRI of the left shoulder was obtained.

FINDINGS: There is normal signal of the marrow. There is no fracture line. The acromioclavicular joint is unremarkable. There is type III acromion. There is os acromiale. There is downsloping of the acromion.

The supraspinatus, infraspinatus, subscapularis, and teres minor tendons are unremarkable.

There is no displaced labral tear. There is no paralabral cyst. The long and short heads of the biceps tendon are intact. The biceps anchor is unremarkable. There is no Hills-Sachs lesion. There is no joint effusion. There is no soft tissue mass. Superior glenoid labrum is intact.

IMPRESSION:

1. Os acromiale
2. Type III acromion with downsloping of the acromion, resulting in narrowing of supraspinatus outlet.
