FILE #: 99521612

PATIENT: HOPSON JOHN
EXAM: MRI OF THE LEFT KNEE

Dear Dr. Walker:

Your patient, Hopson John, had an MRI examination of the left knee without contrast performed on 05/13/2020.

CLINICAL HISTORY: Left knee pain since injury.

TECHNIQUE: MRI of the left knee was performed utilizing a standard imaging protocol on a Hitachi Airis II MRI unit.

FINDINGS: Multiplanar and multisequence MRI of the left knee is performed and reviewed.

Bone marrow signal is within normal limits. There is no evidence of bone marrow edema or fracture. There is no evidence of dislocation.

Examination of the patellofemoral joint demonstrates a joint effusion. There is severe chondromalacia patella. The patellofemoral ligaments and retinacula are intact. The quadriceps and patellar tendons are unremarkable.

The rest of the visualized muscles and tendons demonstrate no acute abnormalities.

All ligaments are intact.

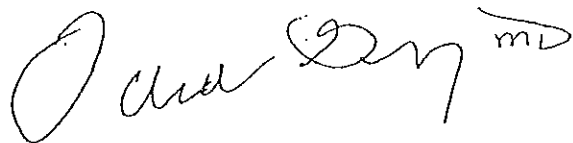

The menisci demonstrate normal signal and configuration. No meniscal tears are noted.

The articular cartilage is unremarkable.

IMPRESSION:

1. SEVERE CHONDROMALACIA PATELLA.
2. SMALL JOINT EFFUSION.

Thank you for referring this patient to us.
