MAGNETIC RESONANCE IMAGING OF THE RIGHT HIP

TECHNIQUE: Multiplanar, multisequential MRI was performed in the 30-degree tilt position.

HISTORY: Patient complains of right hip pain.

INTERPRETATION:

Pubic symphysis is intact. Sacroiliac joints are intact. No fracture of bony pelvis. No hip fracture or avascular necrosis.

Mild lateral hip joint narrowing. Fraying and degeneration of the labrum with superior labral tear noted on coronal imaging. Joint effusion.

Iliopsoas is intact. No bursitis.

Gluteal tendinopathy. No bursitis.

Fat planes around the sciatic nerve are intact. Hamstrings is intact.

No muscle atrophy or tear. No narrowing of the ischiofemoral interval.

No free fluid in the pelvis. No enlarged lymphadenopathy. No inguinal hernia.
