MAGNETIC RESONANCE IMAGING OF THE LEFT KNEE

TECHNIQUE: Multiplanar, multisequential MRI was performed in the 30-degree tilt position.

HISTORY: Patient complains of left knee pain, difficulty walking.

INTERPRETATION: There is medial collateral ligament strain extending to its femoral attachment site. There is anterior cruciate ligament strain.

There is paucity of synovial fluid at the level of the patellofemoral articulation and anteriorly at the tibiofemoral articulation. There is inhomogeneity of the distal quadriceps tendon representing tendinosis/tendinopathy. There is edema of the prepatellar subcutaneous tissues.

Osseous signal and morphology are, otherwise, unremarkable. The medial meniscus, the lateral meniscus, the lateral collateral ligament, the posterior cruciate ligament, and patellar tendon are, otherwise, unremarkable.

IMPRESSION:

- Medial collateral ligament strain extending to its femoral attachment site. Anterior cruciate ligament strain.
- Paucity of synovial fluid at the level of the patellofemoral articulation and anteriorly at the tibiofemoral articulation. Inhomogeneity of the distal quadriceps tendon representing tendinosis/tendinopathy. Edema of the prepatellar subcutaneous tissues.

Thank you for referring your patient to us for evaluation.

Sincerely,

TUNIQUE MCKENZIE
