MRN: MetS7119

LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post motor vehicle accident.

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is infraspinatus tendinitis. The supraspinatus, subscapularis, and teres minor tendons are intact. There is no rotator cuff tear. There is an anteriorly curved acromion likely contributing to rotator cuff impingement

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact.

BICEPS TENDON: Intact long head of the biceps tendon.

LABRUM/LIGAMENTS: There is a tear at the base of the posterior glenoid labrum.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: There is a chronic postfracture deformity of the distal clavicle. There is enthesopathic subcortical fibrocystic change at the greater tuberosity of the humerus.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Tear at the base of the posterior glenoid labrum.

Infraspinatus tendinitis. Anteriorly downsloping acromion likely contributing to rotator cuff impingement.
