AJOY K. SINHA, M.D.  
79-09 B NORTHERN BLVD  
JACKSON HEIGHTS, NY 11372

PATIENT: CESAR BORRAYO  
DOB: 06/12/1964  
DOS: 05/18/2022  
CHART #: 24876  
EXAM: MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

HISTORY: Pain.

TECHNIQUE: Multiplanar MR imaging of the left shoulder was performed without contrast on Hitachi open MRI unit.

Coronal T1, T2 and STIR; Sagittal T2; Axial PD and gradient echo images of the shoulder were obtained.

COMPARISON: None.

Additional sanitizing / safety protocols recommended by the CDC were performed.

FINDINGS: Mild tendinitis changes are seen at the supraspinatus and infraspinatus tendons. There is a type I acromion. There is no impingement. Musculotendinous junction is unremarkable. A focal articular surface tear is noted posteriorly at the infraspinatus tendon measuring 2 x 2 mm.

The subscapularis and teres minor tendons are intact.

There is no subluxation. There is a focal lobulated fluid density seen posterosuperior to the glenoid. A spinoglenoid ganglion is noted measuring up to 12 x 20 mm. A focal tear is seen at the posterior labrum at the upper aspect at the 1 o'clock position seen on image #6 of series #5.

The anterior and posterior labra are intact. There is no biceps tendon tear.

Transverse humeral ligament is unremarkable.

There is no AC separation. There is no lateral downsloping of the acromion. There is no impingement.

There is no muscular injury. There is no seroma.

EXAM: MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

PAGE 2

### IMPRESSION:

1. A FOCAL SPINOGLLENOID GANGLION IS NOTED POSTEROSUPERIORLY, AS DESCRIBED.
2. AN ADJACENT TEAR IS SEEN AT THE POSTERIOR LABRUM AT THE BASE OF THE UPPER ASPECT.
3. MILD TENDINITIS CHANGES ARE SEEN AT THE SUPRASPINATUS AND INFRASPINATUS TENDONS.
4. A FOCAL ARTICULAR SURFACE TEAR IS NOTED POSTERIORLY AT THE INFRASPINATUS TENDON.

Thank you for referring this patient to us.
