PATIENT NAME: ROSELINE NUNEZ
REFERRING PHYSICIAN: JOSEPH MARTONE
SERVICE: MRI LEFT FOOT
DATE OF SERVICE: 10/19/2022

MRI SCAN OF THE LEFT FOOT

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the left foot was performed utilizing multiplanar and multisequence acquisition. The study is limited due to technical factors.

FINDINGS:

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for stress fracture, osteomyelitis, bone contusion, or acute trabecular microfractures.

There is dorsal midfoot soft tissue swelling. The soft tissues and the muscle, fat, and fascial planes are otherwise unremarkable. There are no masses, collections, or cysts. There is no evidence of neuroma formation.

The visualized ligamentous and tendinous structures and the plantar fascia appear intact. No tears are demonstrated.

IMPRESSION:

Dorsal midfoot soft tissue swelling.

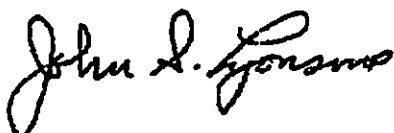

The osseous structures appear intact.

The visualized ligamentous and tendinous structures appear intact.

In the given clinical setting of trauma, the study is otherwise inconclusive which implies the need for further clinical investigation.

Technically limited study. If clinically warranted, a repeat MRI scan should be considered for further evaluation.

Thank you for the courtesy of this consultation.
