**MAGNETIC RESONANCE IMAGING OF THE LEFT SHOULDER WITHOUT
CONTRAST**

TECHNIQUE: Multiplanar, multisequential MRI was performed in the 20-degree tilt position.

HISTORY: The patient complains of left shoulder pain.

COMPARISON: None.

INTERPRETATION: Tendinosis of the distal supraspinatus and infraspinatus. No tear.

Distal subscapularis tendinosis. No tear.

Teres minor intact.

No rotator cuff atrophy.

Hypertrophic change of the AC joint with narrowing of the subacromial space and a lateral downsloping type II acromion.

Intact proximal biceps tendon.

Labral detail is somewhat obscured. There is no displaced tear or paralabral cyst formation.

No joint effusion.

Trace fluid in the subacromial bursa.

No acute fracture. No Hill-Sachs or Bankart lesion.

Intact inferior capsule and glenohumeral ligaments.

IMPRESSION:

- Tendinosis of the distal supraspinatus and infraspinatus.
- Distal subscapularis tendinosis.
- Hypertrophic change of the AC joint with narrowing of the subacromial space and a lateral downsloping type II acromion.
- Trace fluid in the subacromial bursa.

Thank you for referring your patient to us for evaluation.

Sincerely,

A handwritten signature in black ink, appearing to read 'C. Annese', with a long horizontal flourish extending to the right.
