## MRI SCAN OF THE RIGHT KNEE

**HISTORY:** History of MVA.

**TECHNIQUE:** Non-contrast MRI of the right knee was performed utilizing multiplanar and multisequence acquisition. The study is limited due to motion artifact.

## FINDINGS:

There is a severe joint effusion compatible with synovitis. There is no evidence of popliteal cyst formation or muscular tear. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures.

The anterior and posterior cruciate ligaments as well as the medial and lateral collateral ligament complexes appear grossly intact.

The popliteal and quadriceps tendons and the patellar ligament are unremarkable. The patellar retinacula are intact.

The medial and lateral meniscal structures are grossly intact. There is no evidence of a meniscal tear.

## IMPRESSION:

**Motion limited study. If clinically warranted, a repeat MRI scan should be considered for further evaluation.**

**Presence of a severe joint effusion compatible with synovitis.**

**The anterior and posterior cruciate ligaments as well as the medial and lateral collateral ligament complexes appear grossly intact.**

**The meniscal structures appear grossly intact.**

**In the given clinical setting of trauma, the study is otherwise inconclusive which implies the need for further clinical investigation.**
