PT# 170589

Dear Dr. Michael Trimba\*:

**MRI OF THE LEFT KNEE:**

Patient Clinical History: Patient Medical History Unavailable

MRI examination was performed using multiplanar, multisequence imaging.

The study demonstrates normal bony alignment. There is no fracture or dislocation. No focal lytic or sclerotic lesion is identified. No normal anterior cruciate ligament is identified representing tear of the anterior cruciate ligament. The posterior cruciate ligament, medial and lateral collateral ligament complexes and extensor mechanism of the patella are all intact. Examination of the menisci demonstrates an oblique tear at the posterior horn of the lateral meniscus. The medial meniscus is intact. There is a mild knee joint effusion.

**IMPRESSION:**

Full thickness tear of the anterior cruciate ligament. Oblique tear at the posterior horn of the lateral meniscus. Mild knee joint effusion.

Sincerely,
