Patient#: 299033

Dear Dr. Prince:

MRI OF THE LEFT ANKLE

TECHNICAL FACTORS: Noncontrast MRI of the left ankle performed utilizing multiplanar and multisequence acquisition.

FINDINGS: Examination is technically limited due to patient motion artifact.

There is no fracture, dislocation or bone lesion. The bones and muscular structures demonstrate normal signal intensity. There is no muscular tear or evidence of hematoma formation.

Subtalar effusion is seen with sprain injury of talocalcaneal ligaments. Achilles tendon is intact. There is large inferior heel spur with associated mild proximal plantar fasciitis. Sprain injury is seen at distal posterior tibial and peroneus brevis tendons. Anterior tibial, peroneus longus, extensor digitorum and flexor hallucis longus tendons are intact as are interosseous, deltoid and talofibular ligaments.

IMPRESSION:

- Subtalar effusion with sprain injury of talocalcaneal ligaments.
- Sprain injury at distal posterior tibial and peroneus brevis tendons.
- There is large inferior heel spur with associated mild proximal plantar fasciitis.

Thank you for this-referral.

Ralph Dauito, M.D.
