MAGNETIC RESONANCE IMAGING OF THE RIGHT SHOULDER

TECHNIQUE: Multiplanar, multisequential MRI was performed in the 30-degree tilt position.

HISTORY: Patient complains of right shoulder pain with weakness and numbness.

INTERPRETATION: AC joint arthrosis. No separation. No lateral sloping of the acromion. Narrowing of the supraspinatus outlet. No narrowing of the humeral-acromial interval.

Infraspinatus tendinopathy. No muscle atrophy or tear.

Supraspinatus tendinopathy and fraying. No muscle atrophy or tear.

Biceps is intact in the groove and at the anchor. Tendinopathy. No tenosynovitis.

Subscapularis is intact. No muscle atrophy or tear.

Anterior capsular thickening. Posterior capsular thickening.

No fracture, dislocation, or erosion.

Joint effusion. Mild arthrosis of the glenohumeral joint.

Inferior labrum is intact. Superior labral fraying and tear.

IMPRESSION:

- Superior labral fraying and tear. Biceps tendinopathy.
- Glenohumeral joint effusion with no fracture.
