PATIENT NAME: REESE, CHARLES
PATIENT DOB: 06/08/1986
CHART NUMBER: 045523
EXAM DATE: AUGUST 11, 2022
REFERRING PHYSICIAN: DR. CLARKE, COLIN

MRI OF THE RIGHT SHOULDER

Clinical History: Pain; s/p injury.

Protocol: T1 and T2 axial and sagittal images

Findings: The acromioclavicular joint is intact. There appears to be an os acromiale formation. There is undersurface hypertrophy of the acromioclavicular joint impinging upon the supraspinatus muscle tendon complex.

There is tendinosis and partial tear of the distal supraspinatus tendon. The infraspinatus and subscapularis tendons are intact. There is fluid present in the glenohumeral joint and the subacromial/subdeltoid bursa.

The anterior and posterior labrum are grossly intact. The inferior glenohumeral ligamentous complex is intact. There is subchondral cystic change in the humeral head. There is no fracture or bone marrow edema. The long head of the biceps tendon is normally situated in the bicipital groove.

The visualized musculature is normal in signal intensity. There is no subcutaneous mass or abnormal fluid collection.

IMPRESSION:

1. DOWN SLOPING ACROMION PROCESS, WHICH MAY BE IMPINGING UPON THE SUPRASPINATUS MUSCLE TENDON COMPLEX.
2. TENDINOSIS AND PARTIAL TEAR OF THE DISTAL SUPRASPINATUS TENDON.
3. INTACT BICEPS ANCHOR COMPLEX AND INFERIOR GLENOHUMERAL LIGAMENTOUS COMPLEX.

Thank you for the courtesy of this referral.
