

MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

RE: JEAN FRANCOIS, MARTIN
DOS: 10/06/2022
DOB: 07/12/1983
MRN: FC0012388

Referring Physician: Dr. Ross-Distin
Referring physician phone #: (845) 201-5909

CLINICAL INDICATION:

Right shoulder pain status-post motor vehicle accident.

TECHNIQUE:

Multiplanar and multisequence images were obtained.

FINDINGS:

BONE MARROW AND OSSEOUS STRUCTURES: The bone marrow signal intensity is normal.

ACROMIOCLAVICULAR JOINT: The acromion is low lying.

ROTATOR CUFF: There is a partial tear of the supraspinatus tendon characterized by focally increased signal within the critical zone of the supraspinatus tendon that reaches the surface of the tendon on all pulse sequences. It is located 1.6 cm from the insertion site of the greater tuberosity. A joint effusion is present indicating the presence of synovitis/bursitis.

GLENOHUMERAL JOINT AND LABRUM: There is no evidence of glenohumeral joint subluxation. The anterior labrum and the posterior labrum are grossly normal. The visualized portions of the superior, middle and inferior glenohumeral ligaments are normal.

BICEPS TENDON: The long head of the biceps tendon is of normal morphology, location and signal.

IMPRESSION:

1. The acromion is low lying.
2. Partial tear supraspinatus tendon.
3. Joint effusion.
