Fax: (718) 223-2932

PATIENT NAME: Sasha Reyes
DOB: 4/7/1989
DATE OF SERVICE: 11/11/2021
REFERRING DOCTOR: Adnan A. Qureshi, M.D.

MRI Left Shoulder:

TECHNIQUE: Magnetic Resonance Imaging is Performed in Multiple Projections Utilizing T1/T2 Pulse Sequences.

FINDINGS:

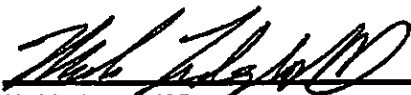

The supraspinatus tendon is torn at its thickened greater tuberosity insertion. Irregular hyperintensity undermines superior bursal and inferior articular surfaces with fiber discontinuity. Frank muscular retraction has not developed.

The visualized glenoid labrum outlines anatomically. Biceps tendon is free from interruption. Some fluid extends along joint capsule and subacromial-subdeltoid bursae. Osseous structures maintain unremarkable alignment and signal characteristics. Suspicion is not raised for fracture, subluxation or replacement process. Humeral head possesses minor greater tuberosity subchondral cystic change. Acromioclavicular joint remains intact. Coracoacromial arch is without appreciable encroachment. No periarthritic mass is declared. Axilla appears clear of lymphadenopathy.

IMPRESSION:

1. Rotator cuff tear sustained.
2. Associated bursitis.
3. No significant bony deformity suspected.

Thank you for the courtesy of this consultation.
