DENNY X. RODRIGUEZ, M.D.  
4720 AVENUE N  
BROOKLYN, NY 11234

PATIENT: JEAN ST. SURIN  
DOB: 02/27/1974 DOS: 08/10/2022 CHART #: 4214  
EXAM: MRI OF THE LEFT ELBOW WITHOUT CONTRAST

HISTORY: Sharp elbow pain, weakness, burning.

TECHNIQUE: Multiplanar MR imaging of the left elbow was performed without contrast on Hitachi open MRI unit.

Coronal T1 and STIR, axial, and sagittal T1 and T2 fat suppressed weighted images of the elbow were obtained.

COMPARISON: None.

FINDINGS: No bone marrow edema, bony lesion or fracture identified.

The articular cartilage is maintained.

There is small-to-moderate effusion in the elbow joint.

Linear increased signal is noted in the superior aspect of the lateral collateral ligament suggesting a partial non-retracted tear.

The medial collateral ligament, flexor and extensor tendons are normal in signal and appearance. The triceps and biceps tendons demonstrate no abnormality. There is soft tissue edema along the posterior aspect of the proximal forearm.

IMPRESSION:

1. FINDING SUGGESTING A PARTIAL TEAR OF THE SUPERIOR ASPECT OF THE LATERAL COLLATERAL LIGAMENT.
2. SOFT TISSUE EDEMA ALONG THE POSTERIOR ASPECT OF THE PROXIMAL FOREARM.
3. SMALL-TO-MODERATE JOINT EFFUSION.

Thank you for referring this patient to us.
