PATIENT: GORDON, RACQUEL
FILE#: 042481
DOB: 08/31/1988
DOS: 07/22/2022
PHYSICIAN: DR. KOPACH, ALEKSANDR

MRI OF THE LEFT SHOULDER

Clinical History: Pain; s/p injury.

Protocol: T1 and T2 axial and sagittal images

Findings: The acromioclavicular joint is intact. There is no fracture or edema of the distal clavicle. There is undersurface hypertrophy which may be impinging upon the supraspinatus muscle tendon complex.

There is tendinosis of the supraspinatus and infraspinatus tendons. There is fluid present in the subacromial/subdeltoid bursa and collecting in the axillary recess. There is fluid in the bicipital groove surrounding the biceps tendon sheath. The subscapularis tendon is intact.

The inferior glenohumeral ligamentous complex is intact. The anterior and posterior labrum are intact. There is no definite evidence of acute labral tear. The visualized musculature is normal in signal intensity.

IMPRESSION:

1. INTACT ACROMIOCLAVICULAR JOINT WITH UNDERSURFACE HYPERTROPHY, WHICH MAY BE CAUSING IMPINGEMENT.
2. SUPRASPINATUS TENDINOSIS WITH FLUID IN THE SUBACROMIAL/SUBDELTOID BURSA AND GLENOHUMERAL JOINT.
3. BICEPS TENDINOSIS. NO ACUTE FRACTURE OR LABRAL TEAR.

Thank you for the courtesy of this referral.
