Report Date: 09/02/2022

DOB: 09/19/1985

Exam Date: 09/01/2022

GORDON DAVIS, DO
1611 EAST NEW YORK AVE
BROOKLYN, NY 11212-

MAGNETIC RESONANCE IMAGING OF THE LEFT SHOULDER

TECHNIQUE: Multiplanar, multisequential MRI was performed in the 30-degree tilt position.

HISTORY: The patient complains of achy left shoulder pain.

COMPARISON: Correlation is made with study of 04/24/2017.

INTERPRETATION: Synovial fluid is again identified in the glenohumeral joint without significant change from prior study. Distal anterolateral supraspinatus tendinosis/tendinopathy is advanced from prior study. There is advancing hypertrophic change in the acromioclavicular joint extending to abut the supraspinatus. 3 mm distal clavicular anterior subcortical erosion is identified. A laterally downsloping acromion is again seen abutting the supraspinatus. Distal anterolateral subscapularis advancing tendinosis/tendinopathy is present. Currently, there is no evidence of significant increased fluid surrounding the long biceps tendon which appears otherwise intact. Anteromedial humeral surface irregularity is again seen underlying the subscapularis.

Examination otherwise demonstrates the osseous structures of the shoulder to be otherwise unremarkable in signal and morphology. Muscular and tendinous structures including remaining portions of the rotator cuff are also felt to remain otherwise unremarkable in signal and morphology. The glenoid labrum and bicipital tendon otherwise appear unremarkable in position and morphology.

IMPRESSION:

- Correlation made with study of 04/24/2017.
- Synovial fluid in the glenohumeral joint without significant change from prior study.
- Distal anterolateral supraspinatus tendinosis/tendinopathy advanced from prior study.

SHOULDER LEFT MRI 73221

- Advancing hypertrophic change in the acromioclavicular joint extending to abut the supraspinatus. 3 mm distal clavicular anterior subcortical erosion. Laterally downsloping acromion abutting the supraspinatus.
- Distal anterolateral subscapularis advancing tendinosis/tendinopathy.
- Anteromedial humeral surface irregularity underlying the subscapularis.

Thank you for referring your patient to us for evaluation.

Sincerely,

Robert Diamond, M.D.

Diplomate of the American Board of Radiology
