PATIENT: VIDAL CABRAL RAFAEL
DOB: 03/07/1964
PHYSICIAN: DR. MATHEW
EXAM DATE: 06/02/2022

MRI OF THE LEFT ANKLE

INDICATION: Pain.

TECHNIQUE: Multiple T1 and T2 weighted images of the left ankle were obtained in axial, sagittal and coronal planes without intravenous contrast.

FINDINGS: There are no acute displaced fractures, dislocations, destructive bony lesions or marrow infiltration. The Achilles tendon, the plantar fascia, the extensor tendons, the flexor tendons, the peroneal tendons, the anterior and posterior talofibular ligaments and the deltoid ligaments are intact.

The posterior talar process appears prominent with surrounding fluid suggestive of posterior ankle impingement, in an appropriate clinical setting. There is moderate calcaneal spur. Mild joint effusion consistent with recent trauma or synovitis, in an appropriate clinical setting.

IMPRESSION:

1. Posterior talar process appears prominent with surrounding fluid suggestive of posterior ankle impingement, in an appropriate clinical setting.
2. Moderate calcaneal spur.
3. Mild joint effusion consistent with recent trauma or synovitis, in an appropriate clinical setting.
