DENNY X. RODRIGUEZ, M.D.
4720 AVENUE N
BROOKLYN, NY 11234

PATIENT: DAPHNEE JEUNE
DOB: 11/13/1984 DOS: 06/27/2022 CHART #: 4132
EXAM: MRI OF THE RIGHT KNEE WITHOUT CONTRAST

HISTORY: Knee pain, radiating down the leg, clicking, locking, difficulty going down the stairs.

TECHNIQUE: Multiplanar MR imaging of the right knee was performed without contrast on Hitachi open MRI unit.

Coronal PD, T2 and STIR; sagittal PD and PD fat suppressed; axial T2 and T2 fat suppressed images of the knee were obtained.

COMPARISON: None.

FINDINGS: There is bone marrow edema involving the medial femoral condyle and medial aspect of the tibial plateau suggesting a bone bruise.

There is a moderate joint effusion.

Lateral tilting of the patella is noted.

There is thinning of the cartilage, subchondral changes of the knee joint involving all three compartments.

Increased signal is noted in the posterior horn of the medial meniscus with extension to the tibial articular surface suggesting a meniscal tear.

The anterior horn of the medial meniscus, lateral meniscus demonstrate no tear.

There is deformity of the lateral meniscus.

The anterior and posterior cruciate ligaments demonstrate no abnormality.

The collateral ligaments, quadriceps and patellar tendons are preserved.

There is prepatellar soft tissue edema.

PAGE 2

IMPRESSION:

1. FINDING SUGGESTING A TEAR OF THE POSTERIOR HORN OF THE MEDIAL MENISCUS WITH EXTENSION TO THE TIBIAL ARTICULAR SURFACE.
2. DEFORMITY OF THE LATERAL MENISCUS.
3. MODERATE JOINT EFFUSION AND LATERAL TILTING OF THE PATELLA.
4. BONE BRUISE INVOLVING THE MEDIAL ASPECT OF THE TIBIAL PLATEAU AND MEDIAL FEMORAL CONDYLE.
5. PREPATELLAR SOFT TISSUE EDEMA.

Thank you for referring this patient to us.
