STAND-UP MRI / 3T MRI**CORALISSE BULGADO****N10123929-
ME****Report Date: 09/02/2022****DOB: 02/21/1988****Exam Date: 09/01/2022****AJIN MATHEW PA
1320 LOUIS NINE BLVD
BRONX, NY 10459****MAGNETIC RESONANCE IMAGING OF THE RIGHT KNEE****TECHNIQUE:** Multiplanar, multisequential MRI was performed in the 16 degree tilt position.**HISTORY:** The patient complains of right knee pain.**INTERPRETATION:** There is lateral patellar subluxation and tilt.

There is free edge truncation and radial tearing involving the body and body-anterior horn junction of the medial meniscus. There is attenuation of the anteromedial bundle of the ACL compatible with partial tear.

There is paucity of synovial fluid at the level of the patellofemoral articulation and anteriorly at the tibiofemoral articulation. There is a slight baja position to the patella with tendinosis/tendinopathy greater distally. There is more prominent degree of tendinosis/tendinopathy involving the distal quadriceps tendon.

There is thickening and sprain of the fibular collateral ligament at its femoral attachment site.

Osseous signal and morphology are, otherwise, unremarkable. The lateral meniscus, the medial collateral ligament, and the posterior cruciate ligament are otherwise unremarkable.

IMPRESSION:

- Lateral patellar subluxation and tilt.
- Free edge truncation and radial tearing involving the body and body-anterior horn junction of the medial meniscus. Attenuation of the anteromedial bundle of the ACL compatible with partial tear.

CORALISSE BULGADO
