

Exam requested by:
DR ALBERTO ROZO MD
86-15 FOREST PKWY
JAMAICA NY 11421

SITE PERFORMED: FLUSHING

SITE PHONE: (718) 544-5151

Patient: NAVARRO, D'ANGELEZE

Date of Birth: 12-27-2000

Phone: (347) 768-6413

MRN: 14239137R Acc: 1021972505

Date of Exam: 02-17-2022

EXAM: MRI LEFT SHOULDER WITHOUT CONTRAST

HISTORY: Shoulder pain

TECHNIQUE: Triplane MRI of the shoulder was performed with fat and water weighted pulse sequences.

COMPARISON: None.

FINDINGS:

The humeral head is well positioned within the glenoid. The glenohumeral joint appears intact.

There is a slightly curved, slightly laterally downsloping acromion process with an intact acromioclavicular joint. There is no significant subacromial impingement.

Tiny benign-appearing subcortical cystic changes are observed in the greater tuberosity. There is no acute fracture, suspicious intrinsic lesion or evidence of avascular necrosis.

There is some tendinosis of the supraspinatus and infraspinatus tendons without a discrete tear. The subscapularis and teres minor tendons appear intact as does the long head the biceps tendon.

The muscles are unremarkable.

There is no significant joint effusion nor significant fluid within the subacromial subdeltoid bursa.

No labral tears are demonstrated on these images.

IMPRESSION:

1. Some tendinosis of the supraspinatus and infraspinatus tendons without a discrete tear.

Thank you for the opportunity to participate in the care of this patient.
