1320 LOUIS NINE BLVD
BRONX, NY 10459****MAGNETIC RESONANCE IMAGING OF THE RIGHT KNEE**

TECHNIQUE: Multiplanar, multisequential MRI was performed in the recumbent position on a high-field 3.0 Tesla magnet.

HISTORY: The patient complains of bilateral knee pain with clicking, swelling and difficulty walking.

INTERPRETATION: The anterior cruciate ligament is diffusely edematous approaching the distal insertion consistent with a sprain.

There is a lateral patellar tilt.

Insertional tendinosis of the distal quadriceps tendon with heterogeneous intrasubstance signal abnormality is seen approaching the distal insertion. There is synovial fluid within the knee joint.

Osseous signal and morphology are, otherwise, unremarkable. The medial and lateral menisci, the medial and lateral collateral ligaments, the anterior and posterior cruciate ligaments, quadriceps and patellar tendons are, otherwise, unremarkable.

IMPRESSION:

- Anterior cruciate ligament is diffusely edematous approaching the distal insertion consistent with a sprain.
- Lateral patellar tilt.
- Insertional tendinosis of the distal quadriceps tendon with heterogeneous intrasubstance signal abnormality approaching the distal insertion. Synovial fluid within the knee joint.

Thank you for referring your patient to us for evaluation.
