RIGHT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Right shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is suture anchors within the greater tuberosity of the humerus consistent with prior supraspinatus and infraspinatus tendon repair. There is interstitial tearing of the infraspinatus tendon. There is supraspinatus and infraspinatus tendinitis. There is thickening and edema of the subdeltoid/subacromial bursa in keeping with bursitis.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: There is mild acromioclavicular joint disease.

BICEPS TENDON: There is tenosynovitis of the extra articular long head of the biceps tendon.

LABRUM/LIGAMENTS: There is no labral tear.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Status post prior rotator cuff repair. Interstitial tearing of the infraspinatus tendon superimposed on infraspinatus and supraspinatus tendinitis. Associated subdeltoid/subacromial bursitis.

Mild acromioclavicular joint disease.
