DOS: 03/05/2019  
DOB: 09/09/1989  
FILE #: 6537

PATIENT: MORENO ROMERO SANTIAGO  
EXAM: MRI OF THE LEFT KNEE

Dear Dr. Touloupoulos:

Your patient, Moreno Romero Santiago, had an MRI examination of the left knee without contrast performed on 03/05/2019.

INDICATION: Pain. Status post injury.

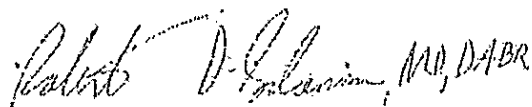

TECHNIQUE: Multi-orthogonal imaging performed using T1-weighted and T2-weighted factors.

FINDINGS: Effusion is noted. There is Baker's cyst and/or pes anserine bursitis. Extensor mechanism of the knee is unrevealing. There is partial ACL tear with thickening and heterogeneity. PCL is unrevealing. Discoid shaped lateral meniscus is noted. There is a partial tear of the posterior horn medial meniscus. Collateral ligament complexes are unrevealing. There is more tearing of the body of the lateral meniscus on coronal dataset. No bone marrow edema pattern is noted.

IMPRESSION:

1. LATERAL AND MEDIAL MENISCAL TEARS AS DESCRIBED.
2. PARTIAL ACL TEAR.
3. BAKER'S CYST VERSUS PES ANSERINE BURSITIS.
4. EFFUSION.

Thank you for referring this patient to us.
