**LEFT SHOULDER MRI WITHOUT CONTRAST**

**HISTORY:** Left shoulder pain status post motor vehicle accident

**TECHNIQUE:** Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

**COMPARISON:** None available.

**FINDINGS:**

**ROTATOR CUFF:** There is infraspinatus tendinitis. The supraspinatus, subscapularis, and teres minor tendons are intact. There is no rotator cuff tear. There is an anteriorly downsloping acromion with subacromial spurring which contribute to rotator cuff impingement.

**MUSCLES:** No muscle edema or fatty muscle atrophy.

**AC JOINT:** Intact.

**BICEPS TENDON:** Intact long head of the biceps tendon.

**GLENOHUMERAL CARTILAGE/LABRUM/LIGAMENTS:** There is a tear at the posterior inferior glenoid chondral labral junction with a 3 mm subchondral cyst.

**SYNOVIUM/JOINT FLUID:** No joint effusion or synovial thickening.

**MARROW:** Normal marrow signal.

**NEUROVASCULAR STRUCTURES:** Normal in course and caliber.

**PERIPHERAL SOFT TISSUES:** Normal.

**IMPRESSION:**

Infraspinatus tendinitis. Evidence of rotator cuff impingement secondary to anteriorly downsloping acromion and subacromial spurring.

Tear at the posterior inferior glenoid chondro-labral junction with a 3 mm subchondral cyst.
