PATIENT NAME:	CARMEN DEL ROSARIO
REFERRING PHYSICIAN:	GAETAN J.MARIE
SERVICE:	MRI RIGHT SHOULDER
DATE OF SERVICE:	05/19/2022

MRI SCAN OF THE RIGHT SHOULDER

CLINICAL HISTORY: Pain.

Routine non-contrast MRI images of the right shoulder were obtained. Prior imaging correlation is not available. The study is limited due to motion artifact.

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. No appreciable impingement is demonstrated.

There is minimal fluid in the subdeltoid bursa and minimal fluid in the joint capsule compatible with tenosynovitis/bursitis. There is no communication between these two fluid compartments across the conjoined tendon. There is increased signal in the myotendinous supraspinatus. There is no evidence of tendon laxity or retraction. There are no appreciable surface defects. In the given clinical setting, the findings are compatible with myotendinous supraspinatus strain/interstitial tear with associated tenosynovitis/bursitis.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable.

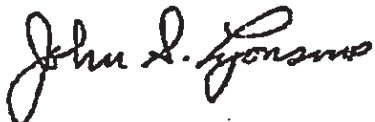

IMPRESSION:

FINDINGS COMPATIBLE WITH MYOTENDINOUS SUPRASPINATUS STRAIN/INTERSTITIAL TEAR WITH ASSOCIATED TENOSYNOVITIS/BURSITIS AS DISCUSSED IN THE BODY OF THE REPORT.

THE VISUALIZED PORTIONS OF THE LABRUM ARE INTACT.

NO ACUTE OSSEOUS ABNORMALITIES.

Thank you for the courtesy of this consultation.

John Lyons, M.D.
Radiologist
