## INITIAL ORTHOPEDIC CONSULT EXAMINATION

**CHIEF COMPLAINT:** Left shoulder, neck, and low back pain.

**HISTORY OF PRESENT ILLNESS:** A 33-year-old left-hand dominant male involved in a motor vehicle accident on 11/17/2021. The patient was a driver and was wearing a seatbelt. The vehicle was T-boned on the driver's side. The airbags did not deploy. The EMS did not arrive on the scene. The police were not called to the scene of the accident. The patient did not go to any hospital that same day. The patient presents today complaining of left shoulder, neck, and low back pain sustained in the motor vehicle accident. The patient was attending physical therapy with little relief.

**WORK HISTORY:** The patient is currently working.

**PAST MEDICAL HISTORY:** Noncontributory.

**PAST SURGICAL HISTORY:** Noncontributory.

**DRUG ALLERGIES:** NO KNOWN DRUG ALLERGIES.

**MEDICATIONS:** The patient is not taking any medications.

**SOCIAL HISTORY:** The patient is a nonsmoker. The patient does not drink alcohol. The patient does not use recreational drugs.

**ADL CAPABILITIES:** As a direct result of the injuries sustained in this accident, the patient states that he is unable to do the following activities: lifting heavy objects and carrying.

.

**PRESENT COMPLAINTS:** Left shoulder: Left shoulder pain is 6/10. The patient is able to reach overhead and behind the back and unable to sleep at night due to pain. Patient is weak, painful abduction, extension and rotation.

**REVIEW OF SYSTEMS:** Temperature taken at the time of exam was 98.6 degrees Fahrenheit.

**General:** No fever, chills, night sweats, weight gain, or weight loss.

**HEENT:** No double vision, eye pain, eye redness, decreased hearing, earache, ear ringing, nosebleeds, sore throat or hoarseness.

**Endocrine:** No cold intolerance, appetite changes or hair changes.

**Skin:** Clear, no rashes or lesions.

**Neuro:** No headaches, dizziness, vertigo or tremor.

**Respiratory:** No wheezing, coughing, shortness of breath or difficulty breathing.

**Cardiovascular:** No chest pain, murmurs, irregular heart rate or hypertension.

**GI:** No nausea, vomiting, diarrhea, constipation, jaundice or changes in bowel habits.

**GU:** No blood in urine, painful urination, loss of bladder control or urinary retention.

**Hematology:** No active bleeding, bruising, anemia or blood clotting disorders.

**Psychiatric:** No anxiety, change in sleep pattern, depression or suicidal thoughts.

**PHYSICAL EXAMINATION:** The patient's height is 5 feet 11 inches, weight is 200 pounds, and BMI is 27.9. The left shoulder reveals positive drop arm test. Positive cross-over test. Negative empty can test. Negative Yergason test. Negative deltoid atrophy. Positive O'Brien test. Positive impingement sign. Negative Lift-off test. Positive Hawkins test. Range of motion, as per goniometer, abduction 120/180 degrees, adduction 30/45 degrees, forward flexion 125/180 degrees, extension 30/60 degrees, internal rotation 30/90 degrees, and external rotation 45/90 degrees. The patient has no motor or sensory deficit of the left upper extremity.

**DIAGNOSTIC TESTING:** MRI of the left shoulder, done on 02/11/2022, shows distal supraspinatus tendon shows significant TW2/PDFS hypertensive signal distally. A full thickness tear of the anterior one-third of the tendon fibers noted with no retraction of tendon. Associated minimal fluid noted in the subacromion- subdeltoid bursa. Mild acromioclavicular joint disease with capsular thickening and small marginal osteophytes. There is lateral downsloping of the acromion with subacromial spurring. These factors contribute to rotator cuff impingement. Trace glenohumeral joint effusion.

**ASSESSMENT:**

1. S46.012A Partial rotator cuff tear, left shoulder.
2. M75.122 Complete rotator cuff tear, left shoulder.
3. M24.812 Internal derangement, left shoulder.
4. M75.02 Adhesive Capsulitis, left shoulder.
5. S43.432A Labral tear, left shoulder.
6. M75.42 Impingement, left shoulder.
7. M65.812 Tenosynovitis, left shoulder.
8. M75.52 Bursitis, left shoulder.
9. M75.22 Bicipital Tendinitis, left shoulder.
10. M25.512 Pain, left shoulder.

11. S49.92XA Injury, left shoulder.
12. M67.212 Hypertrophic synovitis, left shoulder.
13. M25.412 Joint effusion, left shoulder.

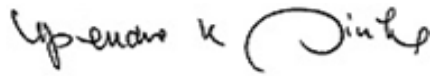

**PLAN:**

1. Imaging studies and clinical examinations were reviewed with the patient.
2. All treatment options discussed with the patient.
3. Cold compresses for left shoulder.
4. Continue anti-inflammatory and muscle relaxant medications p.r.n.
5. Continue physical therapy for left shoulder 3 days/week.
6. Recommend steroid injections with pain management for left shoulder. The patient refuses due to side effects.
7. Discussed left shoulder arthroscopy versus conservative management with the patient. The patient states that due to continual pain and lack of relief with physical therapy and the inability to perform day-to-day activities due to pain, the patient would like to proceed with surgery.
8. It is medically necessary to perform the suggested surgery to properly diagnose the patient's condition and to objectively verify presence and severity of internal derangement and other left shoulder pathology in quantitative and qualitative terms and achieve better prognosis. This surgery is crucial to provide most specific and maximally effective treatment to this patient.
9. Discussed the length of the arthroscopy, the postoperative instructions, and the option of continuing with conservative management alternatives to surgery, including no surgery.
10. All the benefits and risks of the left shoulder arthroscopy have been discussed with the patient. The risks include, but not limited to bleeding, infection, pain, stiffness, muscle injury, nerve injury, DVT, and recurrence.
11. All the questions in regard to the procedure were answered.
12. The patient verbally consents for the arthroscopy of left shoulder and the patient will be scheduled for left shoulder surgery. On the day of the surgery, before the procedure, the surgeon will explain all related questions of the procedure. The patient will sign a written consent and be witnessed by the surgeon.
13. The patient will follow up 1-2 weeks postop or in 2 months if surgery has not been performed yet.

**CAUSALITY:** It is within a certain degree of medical certainty, that the history presented by the patient, the objective physical findings as well as the diagnosis rendered is causally related to the injury the patient incurred on the specified date. These current symptoms were nonexistent prior to the accident. Findings were discussed with the patient.

**AFFIRMATION:** Being duly licensed to practice medicine in the state of New York, pursuant to the applicable provisions of the Civil Practice Laws and Rules, I hereby affirm under penalty of perjury that the statements contained herein are true and accurate.
