PATIENT NAME: GAUTREAUX FERNANDEZ, GIOVANNI
PATIENT DOB: 06/08/1982
CHART NUMBER: 044810
EXAM DATE: MARCH 29, 2022
REFERRING PHYSICIAN: DR.KOPACH, ALEKSANDR

MRI OF THE LEFT SHOULDER

Clinical History: Pain; s/p injury.

Protocol: T1 and T2 axial and sagittal images

Findings: The acromioclavicular joint is intact. There is no fracture or edema of the distal clavicle. There is undersurface hypertrophy, which may be causing impingement.

There is increased signal in supraspinatus tendon consistent with tendinosis. The signal is noted to extend to involve the distal bursal surface consistent with a partial tear. The infraspinatus tendon and subscapularis tendon are intact.

There is fluid in the glenohumeral joint and the subacromial/subdeltoid bursa. The humeral head is normal in position and appearance. There is no fracture or bone marrow edema. The long head of the biceps tendon is normally situated in the bicipital groove.

The anterior and posterior labrum are grossly intact. The inferior glenohumeral ligamentous complex is intact.

The visualized musculature is normal in signal intensity. There is no subcutaneous mass or abnormal collection.

IMPRESSION:

1. INTACT ACROMIOCLAVICULAR JOINT WITH UNDERSURFACE HYPERTROPHY IMPINGING UPON THE MYOTENDINOUS JUNCTION.
2. TENDINOSIS AND PARTIAL TEAR OF THE BURSAL SURFACE OF THE DISTAL SUPRASPINATUS TENDON WITH FLUID IN THE GLENOHUMERAL JOINT AND THE PERI HUMERAL BURSA.

Thank you for the courtesy of this referral.
