

**MRI OF THE LEFT SHOULDER WITHOUT CONTRAST**

RE: LAMOUR, HANDKERSON  
DOS: 10/06/2022  
DOB: 09/11/1994  
MRN: FC0012389

Referring Physician: Dr. Ross-Distin  
Referring physician phone #: (845) 201-5909

**CLINICAL INDICATION:**

Left shoulder pain status-post motor vehicle accident.

**TECHNIQUE:**

Multiplanar and multisequence images were obtained.

**FINDINGS:**

**BONE MARROW AND OSSEOUS STRUCTURES:** The bone marrow signal intensity is normal.

**ACROMIOCLAVICULAR JOINT:** There is productive change seen at the acromioclavicular joint, which is effacing the subdeltoid fat plane and encroaching on the supraspinatus muscle tendon complex.

**ROTATOR CUFF:** There is diffusely increased signal within the supraspinatus tendon consistent with tendinosis of the tendon. There is no definite evidence of tear or retraction.

**GLENOHUMERAL JOINT AND LABRUM:** There is no evidence of glenohumeral joint subluxation. The anterior labrum and the posterior labrum are grossly normal. The visualized portions of the superior, middle and inferior glenohumeral ligaments are normal.

**BICEPS TENDON:** The long head of the biceps tendon is of normal morphology, location and signal.

**IMPRESSION:**

1. Productive change at the acromioclavicular joint, which is encroaching on the supraspinatus muscle tendon complex.
2. Supraspinatus tendinosis.
