PATIENT: HENRY, PATRICIO
FILE#: 042505
DOB: 01/18/1994
DOS: 07/21/2022
PHYSICIAN: DR. KOPACH, ALEKSANDR

MRI OF THE LEFT SHOULDER

Clinical History: Pain; s/p injury.

Protocol: T1 and T2 axial and sagittal images

Findings: The acromioclavicular joint is intact. There is no fracture or edema of the distal clavicle.

There is tendinosis and partial tear of the bursal surface of the distal supraspinatus tendon with fluid in the glenohumeral joint and the subacromial/subdeltoid bursa. The infraspinatus tendon is intact with increased signal consistent with tendinosis. The subscapularis tendon is intact.

The humeral head is normal. There is no fracture or bone marrow edema. The long head of the biceps tendon is normally situated in the bicipital groove.

The anterior and posterior labrum are intact. The inferior glenohumeral ligamentous complex is intact.

The visualized musculature is normal in signal intensity. There is no subcutaneous mass or abnormal fluid collection.

IMPRESSION:

1. INTACT ACROMIOCLAVICULAR JOINT WITH DOWN SLOPING ACROMION PROCESS, WHICH MAY BE CAUSING IMPINGEMENT.
2. TENDINOSIS AND PARTIAL TEAR OF THE BURSAL SURFACE OF THE DISTAL SUPRASPINATUS TENDON WITH FLUID IN THE SUBACROMIAL/SUBDELTOID BURSA.

Thank you for the courtesy of this referral.
