MRI SCAN OF THE LEFT ELBOW

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the left elbow was performed utilizing multiplanar and multisequence acquisition. A posteromedial surface marker was placed over the area of clinical concern.

FINDINGS:

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusion, stress fractures, or acute trabecular microfractures. There is elbow joint fluid compatible with synovitis.

The visualized ligamentous and tendinous structures are intact. There is no evidence of tear.

The muscle, fat, and fascial planes are well maintained. There is no evidence of muscular tear.

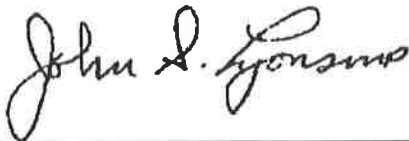

IMPRESSION:

Presence of elbow joint fluid compatible with synovitis.

The visualized ligamentous and tendinous structures are intact.

In the given clinical setting of trauma, the study is otherwise inconclusive which implies the need for further clinical investigation.

Thank you for the courtesy of this consultation.

John Lyons, M.D.

Radiologist
