PATIENT NAME: RAYMOND VIDAL
REFERRING PHYSICIAN: CATHY DELERME-PAGAN
SERVICE: MRI LEFT SHOULDER
DATE OF SERVICE: 10/21/2022

MRI SCAN OF THE LEFT SHOULDER

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the left shoulder was performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. There is AC joint arthrosis and malalignment of the AC joint with secondary impingement upon the underlying supraspinatus muscle.

There is normal fluid in the subdeltoid bursa as well as normal fluid in the joint capsule. There is no communication between these two fluid compartments across the conjoined tendon. There is increased signal in the myotendinous supraspinatus. There is no evidence of tendon laxity or retraction. There are no appreciable surface defects. In the given clinical setting, the findings are compatible with myotendinous supraspinatus strain/interstitial tear.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable. There is no evidence of labral tear.

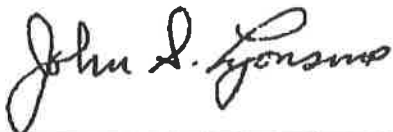

IMPRESSION:

AC joint arthrosis and malalignment with impingement.

Findings compatible with myotendinous supraspinatus strain/interstitial tear as discussed in the body of the report.

The visualized portions of the labrum are intact.

Thank you for the courtesy of this consultation.

John Lyons, M.D.
Radiologist
