**PATIENT NAME:** MAIESHA JOSEPHS  
**REFERRING PHYSICIAN:** JOSEPH MARTONE  
**SERVICE:** MRI LEFT SHOULDER  
**DATE OF SERVICE:** 10/21/2022

---

## MRI SCAN OF THE LEFT SHOULDER

**HISTORY:** History of MVA.

**TECHNIQUE:** Non-contrast MRI of the left shoulder was performed utilizing multiplanar and multisequence acquisition.

### FINDINGS:

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. There is AC joint arthrosis and malalignment of the AC joint with impingement upon the underlying supraspinatus muscle.

There is mild fluid in both the subdeltoid bursa and joint capsule compatible with tenosynovitis/bursitis. There is no communication between these two fluid compartments across the conjoined tendon. There is increased signal in the myotendinous supraspinatus. There is no evidence of tendon laxity or retraction. There are no appreciable surface defects. In the given clinical setting, the findings are compatible with myotendinous supraspinatus strain/interstitial tear with associated tenosynovitis/bursitis.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable. There is no evidence of labral tear.

There is increased signal in the coracohumeral ligament. There is no evidence of retraction or laxity. No surface defect is seen. In the given clinical setting, the finding is compatible with a sprain/interstitial tear. Clinical confirmation is requested.

### IMPRESSION:

**AC joint arthrosis and malalignment with impingement.**

**Myotendinous supraspinatus strain/interstitial tear with associated tenosynovitis/bursitis as discussed in the body of the report.**

**Findings compatible with sprain/interstitial tear of the coracohumeral ligament as described above.**

**The visualized portions of the labrum are intact.**
