**PATIENT NAME:** TONY HAYES  
**REFERRING PHYSICIAN:** PHYLLIS GELB  
**SERVICE:** MRI LEFT KNEE  
**DATE OF SERVICE:** 07/24/2022

---

## MRI SCAN OF THE LEFT KNEE

**HISTORY:** History of MVA.

**TECHNIQUE:** Non-contrast MRI of the left knee was performed utilizing multiplanar and multisequence acquisition.

### FINDINGS:

There is joint fluid compatible with synovitis. There is no evidence of popliteal cyst formation or muscular tear. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures.

Degenerative osseous and meniscal changes are present. The meniscal structures are otherwise intact. There is no evidence of a meniscal tear.

The anterior and posterior cruciate ligaments as well as the medial and lateral collateral ligament complexes are intact.

The popliteal and quadriceps tendons and the patellar ligament are unremarkable. The patellar retinacula are intact.

### IMPRESSION:

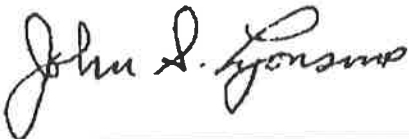

**Presence of joint fluid compatible with synovitis.**

**Degenerative osseous and meniscal changes. The meniscal structures are otherwise intact.**

**The anterior and posterior cruciate ligaments as well as the medial and lateral collateral ligament complexes are intact.**

**In the given clinical setting of trauma, the study is otherwise inconclusive which implies the need for further clinical investigation.**

Thank you for the courtesy of this consultation.
