

To: Davis, Gordon

Exam: MRI LEFT SHOULDER

Exam Date: 10/03/2022 11:22 AM

Accession: 32900

Patient Name: Diaz-Valdez, Luis

DOB: 11/25/1983

Gender: M

MRN: DiaL7103

LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is supraspinatus and infraspinatus tendinitis. The subscapularis and teres minor tendons are intact. There is no rotator cuff tear. There is subdeltoid/subacromial bursal fluid in keeping with bursitis. There is thickening of the coracoacromial ligament and subacromial spurring which result in rotator cuff impingement.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact.

BICEPS TENDON: Intact long head of the biceps tendon.

LABRUM/LIGAMENTS: No labral tear.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Supraspinatus and infraspinatus tendinitis with subdeltoid/subacromial bursitis. Evidence of rotator cuff impingement secondary to subacromial spurring and thickening of the coracoacromial ligament.
