PATIENT NAME:	MATTHEW HUSTON
REFERRING PHYSICIAN:	DR. ALEXANDER KOPACH
SERVICE:	MRI RIGHT SHOULDER
DATE OF SERVICE:	06/03/2022

MRI SCAN OF THE RIGHT SHOULDER

CLINICAL HISTORY: Pain.

Routine non-contrast MRI images of the right shoulder were obtained. Prior imaging correlation is not available.

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. AC joint impingement is demonstrated.

The conjoined tendon is intact. There is normal fluid in the subdeltoid bursa and normal fluid in the joint capsule. There is no communication between these two fluid compartments across the conjoined tendon. There is no evidence of tendon laxity or retraction. There are no appreciable surface defects to be suspicious for focal partial tears.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable.

IMPRESSION:

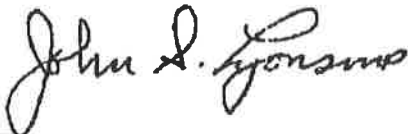

PRESENCE OF AC JOINT IMPINGEMENT.

THE ROTATOR CUFF STRUCTURES ARE INTACT.

THE VISUALIZED PORTIONS OF THE LABRUM ARE UNREMARKABLE.

IN THE GIVEN CLINICAL SETTING OF TRAUMA, THE STUDY IS OTHERWISE INCONCLUSIVE WHICH IMPLIES THE NEED FOR FURTHER CLINICAL INVESTIGATION.

Thank you for the courtesy of this consultation.

John Lyons, M.D.

Radiologist
