FILE #: 388PATIENT: SHAKHLO MAMATOVA
EXAM: MRI OF THE LEFT KNEE

Dear Dr. Goldenberg:

Your patient, Shakhlo Mamatova, had an MRI examination of the left knee without contrast performed on 08/25/2020.

CLINICAL HISTORY: Left knee pain since injury.

TECHNIQUE: MRI of the left knee was performed utilizing a standard imaging protocol on a Siemens 1.5T MRI unit.

FINDINGS: Multiplanar and multisequence MRI of the left knee is performed and reviewed.

Bone marrow signal is within normal limits. There is no evidence of bone marrow edema or fracture. There is no evidence of dislocation.

There is physiologic joint fluid. The patellofemoral joint is unremarkable. The articular cartilage is intact. The patellofemoral ligaments and retinacula are intact.

The quadriceps and patellar tendons are normal.

The rest of the visualized muscles and tendons are unremarkable.

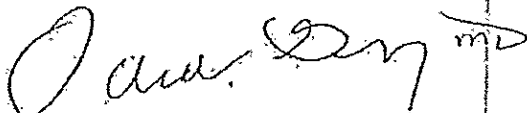

All ligaments are intact.

Examination of the menisci demonstrates normal signal and configuration. There are no meniscal tears noted. The articular cartilage is unremarkable. A ganglion cyst is seen adjacent to the posterior root of the medial meniscus.

IMPRESSION:

NO ACUTE ABNORMALITIES. SMALL GANGLION CYST SEEN ADJACENT TO THE POSTERIOR ROOT OF THE MEDIAL MENISCUS.

Thank you for referring this patient to us.
