PATIENT NAME	ELISME, LIPHETE
D.O.B.	02/01/1997
PATIENT #	300
DATE OF SERVICE	6/8/2022 6:52:05 PM
REF. PHYSICIAN	RAHMAN, QUAZI MD

MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

INDICATION: MVA. Right shoulder pain

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD, axial, coronal, and sagittal sequences were obtained.

FINDINGS:

No fracture or suspicious lesion. No os acromiale, low-lying acromion, or intra-articular loose body. No evidence of significant arthritis and glenohumeral cartilage grossly intact.

Infraspinatus tendinosis with a broad undersurface fraying suggesting a tear more toward the anterior insertional fibers toward the conjoined region overlying the greater tubercle. Series 5 image 7.

There is hyperintense, curvilinear signal suggesting not only small glenohumeral effusion, but also raising suspicion for concomitant tear of the anteroinferior labrum between approximately 3:00 and 6:00 positions 6 images 11, 12.

Subscapularis tendon is normal. Intact biceps tendon and bicipital labral anchor complex.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No subacromial/subdeltoid bursitis.

IMPRESSION:

1. Infraspinatus tendinosis with a broad undersurface fraying suggesting a tear more toward the anterior insertional fibers toward the conjoined region overlying the greater tubercle. Series 5 image 7.
